

Environmental policy

We are Minsur, world-class Peruvian mining company that produces tin, gold, niobium and tantalum; world leader in the tin market with mining projects in Peru and Brazil. We reaffirm our commitment to the protection and care of the environment when developing our activities, according to our vision, mission and values.

Key elements:

Air quality

Maintaining air quality is essential to wildlife and human health. We have designed and implemented measures to minimize the generation of particulate matter and gas emissions from our activities.

Biodiversity

We are aware of how significant it is to conserve biodiversity for the life in our planet, the social wellbeing and economic development.

Water management

We manage water to minimize risks and impacts and take advantage of opportunities associated to water use and environmental services, both for the ecosystem as well as for other stakeholders related to the use of water.

Mine closure

We rehabilitate the areas used for mining operations, defining the closure concepts from the project's design, aiming -to the extent possible- at recovering the natural conditions initially identified.

Climate change

Our environmental management incorporates measures to mitigate climate change.

We pledge to:

1. Identify, assess, prevent, monitor, mitigate and eventually offset environmental aspects and impacts in our activities, efficiently managing resources, inputs, products, by-products, processes and waste at the different stages of the mine lifecycle.

Environmental policy

2. Identify, assess and manage risks and opportunities at the different stages of the mine lifecycle, minimizing negative impacts and maximizing positive impacts, ensuring that air quality, biodiversity, water, mine closure and climate change mitigation are key elements for investment decision-making and strategic planning.
3. Fulfill legal obligations, agreements, conventions and others entered into with agencies and stakeholders, and comply with Minsur's policies, standards and regulations.
4. Implement, maintain and continuously upgrade our environmental management, governance and compliance systems, producing positive and sustainable impacts in the long term, streamlining development in the region for generations to come.
5. Periodically establish, measure, report and communicate our operations' environmental performance, according to domestic regulations and the best international practices.
6. Promote the development of an environmental culture based on good prevention and mitigation practices, and participate in activities that enhance sustainable development with our stakeholders.

Lima, March 2021

Juan Luis Kruger Sayán
